BACKGROUND

- PRL-02 is a long-acting IM depot injection of abiraterone decanoate, a novel lipophilic prodrug of abiraterone that is delivered through the lymphatic system
- In a castrate monkey model, single-dose PRL-02 suppressed testosterone (T) through 14 weeks to levels comparable to clinical results with oral abiraterone acetate (AA) but with lower and less variable plasma exposures¹
- PRL-02 appears to minimally inhibit CYP17 hydroxylase and preferentially inhibit CYP17 lyase, which blocks androgens without harmful increases in mineralocorticoids or depletion of steroids in the glucocorticoid pathway (Figure 1)
- Progesterone, in particular, is a known oncogenic driver that activates canonical and non-canonical receptor target genes
- Nonclinical study results show higher abiraterone exposures from PRL-02 compared to oral AA in adrenal, lymph, and bone and lower exposures in liver, brain, and plasma, suggesting that PRL-02 has the potential for a superior therapeutic index and safety profile compared to oral AA²

OBJECTIVE

The results of an ongoing dose-escalation Phase 1 study evaluating the safety, pharmacokinetics, and efficacy of PRL-02 are presented

METHODS

- Phase 1 is a standard 3+3 design intended to identify a recommended phase 2 dose (RP2D)
- PRL-02 is administered as an IM injection every 84 days (1 cycle) with daily oral dexamethasone or prednisone
- Patients (pts) with metastatic castrate resistant or sensitive prostate cancer (mCRPC/mCSPC) and a screening T of 2 - 50 ng/dL were included
- Pts with prior treatment with a CYP17 inhibitor and/or concurrent treatment with an AR-blocking agent are excluded
- T levels are assessed at least every 14 days starting from Day 1 of Cycle 1 and every 28 days of all cycles thereafter
- PSA is assessed pre-dose on Day 1 of Cycle 1 and every 28 days of all cycles thereafter

RESULTS

- As of Jan 9, 2023, 22 pts (9 mCRPC, 12 mCSPC, 1 CSPC) were treated across 5 dose cohorts (180, 360, 720, 1,260, 1,800 mg) (Figure 2)
- Generally, there was a dose-proportional increase in abiraterone concentrations following a single dose of PRL-02 with a T max of 14 - 28 days and a plasma half-life of 18.3 days (Figure 3)
- The median baseline T level, calculated from mean of screening and Day 1 of Cycle 1 pre-dose samples, was 7.45 ng/dL
- Among pts dosed at 720 mg and above:

Patient (m)CSPC/

3 Complete Response

- 13 of 16 pts had a 90% reduction in T or values ≤ 1 ng/dL at day 28 (Figure 2)
- The median baseline PSA level was 3.01 ng/mL, and PSA50 was observed in 15 of 16 pts, while PSA90 was observed in 8 of 16 pts postbaseline (Figure 4)
- There were no treatment-related serious adverse events (AEs) or doselimiting toxicities (Table 1)
- G2-related AEs were fatigue, decreased appetite, insomnia, hot flush, and peripheral edema
- Dose-response trends in 'up-stream' steroids (e.g., progesterone (P) and corticosterone (C)) were observed (Table 2)
- Although serial radiology was not prospectively required, there was a radiographic improvement in 6 pts with data available

2 Treatment Emergent Adverse Event

Table 2. Mean Percent Change from Baseline for **Up-Stream Steroids for PRL-02**¹

	Up-Stream	Day					
Dose Group	Steroids	14	28	56	84		
720 mg	Progesterone	-1	-2	0	0		
(N=4)	Corticosterone	48	27	9	-33		
1,260 mg	Progesterone	20	35	0	0		
(N=6)	Corticosterone	184	490	19	32		
1,800 mg	Progesterone	165	86	12	13		
(N=6)	Corticosterone	455	259	54	109		

1 Data Cutoff Date: January 9, 2023

CONCLUSIONS

- PRL-02 was well tolerated, with minimal adverse effects observed at all
- Dose-dependent T suppression was associated with clinical benefits including PSA responses and radiographic improvement
- Minimal to no increases in P and C were observed in this study
- Based on less P increases with similar T reductions in patients treated with 1,260 mg PRL-02 compared to 1,800 mg, the provisional RP2D is 1,260 mg

IMPLICATIONS

- The available clinical data for PRL-02 confirms the potential for a superior therapeutic index and improved patient convenience compared to daily oral AA + prednisone
- Wright et al. 2020 reported substantial increases in median P (4000%) and C (8593%) in patients treated with oral AA + prednisone³
- The lack of rises in P provides a mechanistic basis for the hypothesis that IM PRL-02 may have superior clinical activity over daily oral AA + prednisone
- These hypotheses will be tested in an ongoing Phase 2 study in which the RP2D will be 1,260 mg
